WORLD MINE PRODUCTION OF GOLD

The Gold Institute/l'Institut de l'Or has been fortunate to obtain the cooperation of more than 300 mining and related enterprises for the preparation of World Mine Production of Gold. In this report, mine production is defined as the gold produced from underground, surface, and alluvial sources.

Totals in thousands of troy ounces are given for each country known or expected to produce at least one thousand troy ounces of gold annually from these sources.

The countries are divided into International Trade Countries and Eastern Bloc Countries, with each group arranged in the order of size of their actual production in 1979. For each country, estimated production in 1980 is given, as well as planned or projected production for each of the years 1981, 1982, and 1983.

For the totals of each group of countries, and for the world totals, there are shown the equivalents in metric tons, as well as the percentages of change from the previous years.

An additional summary divides world production figures into three parts: those of the largest producing country, the second largest producing country, and the total of all other producing countries.

Following the presentation of the gold production figures are the names of the mining and related enterprises which cooperated by providing information for this study, listed alphabetically by country.
